

Well almost home (Changi Airport, Singapore) and just time for one last post. How to describe the last three incredible days? Imagine the thrill of discovering the leading edge in sustainable (economic, environmental and social) residue recovery. The big debate for the Swedes is nutrient balances. Looks like the economics is pretty much done and dusted. They are even investigating stump removal for biomass harvesting, although this may be a few years off - main problems are quality, cost and environmental issues. I have a heap of notes.

Then two days of looking at practical recovery of biomass and chipping etc, plus the odd moose burger. See you round.....
